

Task

- **Task:** 9
 - **Level:** 0
 - **Deadline:** 15/5/2025
-

Overview

You are building an enhanced to-do list application where users can **add**, **edit**, **complete**, **delete**, and **filter tasks**.

Features to Include

Start by setting up a simple UI with an **input field** for users to enter a task, and a **Add Task button**, and a section to display the list of tasks.

Users should be able to add tasks by pressing **"Enter"** on their keyboard or the **Add Task button**.

Each task should also include three buttons:

- **Complete Button** → To toggle a task as completed (strike-through effect).
- **Edit Button** → To modify the task text.
- **Delete Button** → To remove the task from the list.

To improve usability, add three filter buttons: **Show All**, **Show Completed**, and **Show Pending**. These should switch between viewing all tasks, only completed ones, or only pending ones

Bonus Challenge

Make the tasks remain on the page even after a refresh by saving them in `localStorage`. And update the `localStorage` whenever a task is updated.
